Job description

Eon.io - Software Engineer

Job URL

Software Engineer

Eon is building cloud backup data infrastructure that makes enterprise backup data searchable, accessible, and AI-ready. The Growth Engineer will build software, AI, data, automation, web, and distribution systems to generate demand, create pipeline, run experiments, and expand Eon’s reach to technical customers.

Responsibilities

Identify and build AI and automation use cases that make our demand generation and pipeline generation faster and more scalable

Build workflows and agents using tools such as Claude, Clay, LLM APIs, and custom code

Connect data across Salesforce, HubSpot, Gong, our website, product data, and third-party sources to identify signals and trigger actions

Build systems that help the growth team research accounts, identify intent, personalize outreach, launch experiments, and measure results

Build and automate parts of our paid acquisition infrastructure, including audience creation, campaign setup, and optimization across LinkedIn and Google

Own the technical side of eon.io — from page architecture and personalization to experimentation and CRO infrastructure

Build tools that make it dramatically cheaper and faster to test new GTM ideas

Work closely with Marketing and Revenue Operations. They own our core systems; you build new capabilities on top of them

Find technical opportunities for Eon to reach cloud, infrastructure, data, and security teams in ways our competitors aren’t

Build free tools, calculators, benchmarks, datasets, and technical resources that our target customers actually want to use and share

Turn Eon’s technical expertise and product capabilities into things people can experience rather than just read about

Build distribution through developer communities, technical ecosystems, integrations, marketplaces, and other channels

Experiment with referral, sharing, and product-led mechanics that can create compounding distribution

Identify emerging AI platforms, APIs, developer ecosystems, and other channels before they become crowded

Prototype quickly, measure what works, kill what doesn’t, and double down on the signals

Find out how your skills align with this job's requirements. If anything seems off, you can easily click on the tags to select or unselect skills to reflect your actual expertise.

PythonTypeScriptAPIsWebhooksSQLAI Coding ToolsLLM APIsAI AgentsAI-Powered WorkflowsWeb DevelopmentSalesforceHubSpot

Required

3+ years building and shipping production software

Strong coding skills and the ability to take an idea from zero to production independently

Experience with Python and/or TypeScript, APIs, webhooks, and SQL

Deep, hands-on experience with AI coding tools such as Claude Code, Cursor, or equivalent

Experience building with LLM APIs, agents, or AI-powered workflows

A strong understanding of how systems connect — APIs, data, automation, web, and third-party platforms

A builder mindset: you like figuring things out yourself, moving quickly, and learning by shipping

Curiosity about growth, distribution, marketing, and how companies acquire customers

Evidence that you've built something outside of your core job that people actually used, whether it's a product, tool, open-source project, automation, or technical experiment

Preferred

Experience with Salesforce, HubSpot, Gong, ad platform APIs, or marketing automation

Experience with growth, marketing, GTM, or developer relations

Experience building tools or products for technical audiences

A presence or reputation in a technical community

Experience in cloud infrastructure, data, backup, security, or adjacent markets

Benefits

Equity Participation (RSUs!)

401K match

Paid Parental Leave

Generous benefits including medical, dental, and vision options available to you

Vibrant office with meals, happy hours, employee events, and volunteer days

Home office setup and culture events for remote employees
