Cover letter

Docker, Inc - Senior Salesforce Developer

Job URL

Dear Hiring Manager,

With over seven years of hands-on experience architecting and developing enterprise Salesforce solutions, I am excited to contribute as a Senior Salesforce Developer at Docker. I have a strong track record of delivering scalable Salesforce implementations incorporating Apex, Lightning Web Components, MuleSoft integrations, and AI-driven automation that directly address challenges with workflow optimization, data governance, and platform scalability.

At Docker, I can leverage my expertise leading Salesforce architecture and DevOps practices, including Gearset-managed CI/CD pipelines and governance standards, to ensure robust, maintainable releases. During my tenure at Docker and AWS, I optimized Salesforce automations processing over 250,000 records monthly while reducing failures by 20%, demonstrating a capacity to improve performance in complex environments.

Additionally, my experience integrating Agentforce and Einstein AI capabilities aligns tightly with Docker's focus on evolving intelligent CRM workflows. I excel at partnering across Sales, Marketing, and Operations teams to translate business needs into secure, efficient Salesforce solutions and am comfortable owning full release lifecycles and strategic platform planning.

I am confident my technical depth, analytical skills, and leadership in Salesforce ecosystem management will contribute meaningfully to Docker's mission of delivering developer tooling and secure infrastructure. I look forward to discussing how I can help advance your Salesforce platform to meet evolving business demands.

Sincerely,
Triet Le
