Job description

GBG Plc - Salesforce Developer (4057)

Job URL

Salesforce Developer (4057)

GBG is a technology company that enables safe and rewarding digital lives through identity and address verification solutions. The Salesforce Developer will design, build, and own Salesforce solutions across Core, Sales Cloud, Service Cloud, Experience Cloud, CPQ, and Billing, while contributing to architecture, deployments, troubleshooting, testing, and platform standards.

Responsibilities

Design and build using whichever tool fits the job — Flow, validation rules, and configuration where that's the right long-term answer; Apex and LWC where genuine complexity demands code

Take ownership of a young, largely greenfield codebase — helping set the standard for what “good” looks like, rather than untangling what came before

Make deliberate, defensible calls between optimisation and pragmatism: knowing when a quick, sound solution beats an elegant one, and when it doesn't

Work within established CoE technical standards and best practices (documented in Confluence) for Apex, Flow, and test coverage

Own deployment through Gearset, following the team's environment promotion path with discipline

Produce solution designs and technical documentation for platform changes — the emphasis is on designing and documenting how something will be built

Run prototypes and technical spikes to de-risk uncertain requirements or test an approach before committing to a build and to bring ideas to life for the business

Triage and debug platform issues, tracing root cause across configuration, code, and managed package behaviour rather than just addressing symptoms

Contribute to solution design and architecture conversations, bringing a point of view on build approach, not just execution

Bring working exposure to Claude (or comparable AI tooling), with judgement on when AI-assisted approaches genuinely speed up delivery and when they introduce more risk or rework than they save

Help the team strike the right balance between speed and quality when deciding where to lean on AI assistance in design, build, or testing

Help keep the codebase clean as it grows — flagging when configuration is drifting toward unnecessary complexity, or when code is doing a job declarative tooling should

Contribute to automated test coverage where appropriate, with exposure to tools such as Playwright considered a strong plus

Qualification

Find out how your skills align with this job's requirements. If anything seems off, you can easily click on the tags to select or unselect skills to reflect your actual expertise.

Salesforce DevelopmentApexLightning Web Components (LWC)SOQLSalesforce FlowSalesforce CPQ and BillingSalesforce Solution DesignGearsetSalesforce Platform DebuggingAutomated TestingSalesforce Certifications

Required

Strong hands-on experience with both programmatic development (Apex, LWC, SOQL) and declarative Salesforce (Flow, validation rules, permission sets) — with genuine judgement on when to use which

Experience with Salesforce CPQ and/or Billing packages specifically (managed package quirks, governor limits, and constraints that come with them)

Experience producing solution designs and technical documentation, rather than functional or user -story-level requirements

Comfortable running prototypes or spikes to validate an approach, and confident triaging and debugging complex platform issues

Experience using Gearset (or a comparable DevOps tool) to manage deployments across a multi-org promotion path

Comfortable owning code quality in the absence of a large existing team or dense peer-review culture — someone who holds their own bar high

Strong written communication — comfortable documenting decisions and designs async, for a team that isn't always online at the same time

Experience working in a small, distributed team across multiple geographies, cultures, and time zones, with the flexibility that requires

Preferred

Working exposure to Claude or similar AI-assisted development tooling, with a view on where it genuinely adds value in a Salesforce delivery context

Experience producing automated test suites; exposure to Playwright or similar tools is a strong plus

Relevant Salesforce certifications (Platform Developer, CPQ Specialist, or equivalent)

Prior experience in a Salesforce CoE or product-centric delivery model

Exposure to Sales Cloud and/or Service Cloud alongside CPQ/Billing

Benefits

Remote work
