Job description

Avalara - Salesforce DevOps Release Engineer

Job URL

Salesforce DevOps Release Engineer

Avalara is an AI-first company that provides cloud compliance technology. The Salesforce DevOps Release Engineer will lead release management and deployment pipelines across Salesforce, Boomi, and AWS, while establishing governance, automation, monitoring, rollback procedures, and cross-team engineering standards.

Artificial Intelligence (AI)LegalFinanceSoftwareAccountingComplianceFinancial ServicesTax Preparation

H1B Sponsor Likely

Responsibilities

Review and validate Salesforce, Boomi, and AWS deployment requests, ensuring you check change sets for dependency conflicts before promoting them between environments

Develop CI/CD pipelines using Salesforce CLI, change sets, and GitLab for Salesforce deployments, alongside Terraform for AWS infrastructure provisioning

Troubleshoot deployment failures with engineering teams and maintain automated rollback procedures to minimize production impact

Build monitoring dashboards to ensure deployment issues are identified and addressed before they affect customers

Establish and enforce release governance standards including approval gates, dependency checks, environment promotion criteria, and change advisory board (CAB) processes

Define and report on important deployment metrics — deployment frequency, change failure rate, mean time to recovery (MTTR), and lead time for changes — to improve release performance

Partner with security and compliance teams to ensure all deployments meet organizational controls, audit requirements, and regulatory standards

Develop runbooks, deployment strategies, and operational documentation to ensure repeatability and knowledge transfer across engineering teams

Hold standards for release quality, deployment reliability, automation across Salesforce, Boomi, and AWS environments

Create a culture of "automation first" by eliminating manual deployment activities, reducing operational risk, and improving deployment velocity through scalable CI/CD practices

Use data, operational metrics, and production insights — not assumptions — to improve deployment success rates, release predictability, change failure rates, and recovery times

Simplify complex cross-platform deployment workflows into standardized, repeatable, and release processes that scale with business growth

Establish and improve engineering guardrails, including dependency validation, release governance, automated testing, approval gates, rollback strategies, and deployment observability

Mentor developers, integration engineers, and platform teams on DevOps best practices, release discipline, Infrastructure as Code, and to raise engineering across the organization

Challenge existing deployment practices respectfully and driving continuous improvements that reduce technical

debt, improve system reliability, and strengthen collaboration

Stay current with modern DevOps, platform engineering, cloud infrastructure, and AI-assisted engineering capabilities, introducing practical innovations that improve developer productivity while maintaining security and governance

Leave every deployment pipeline, release process, operational framework, and engineering standard stronger and easier to operate than before

Identify and adopt AI-powered tools that improve deployment pipeline efficiency, such as AI-assisted code review, intelligent test selection, anomaly detection in deployment telemetry, and predictive change risk scoring

Champion the use of AI and automation to eliminate repetitive, error-prone manual release activities. Use tools like GitHub Copilot, AI-assisted runbook generation, or LLM-driven incident summarization to accelerate engineering workflows

Evaluate and pilot new AI-native DevOps capabilities (e.g., AI-powered observability, automated root cause analysis, intelligent rollback triggers) and bring well-reasoned recommendations to the team

Model responsible AI use — applying AI tools with appropriate governance, validating AI-generated outputs, and maintaining human accountability for all production decisions

Mentor peers on practical AI tool usage within the DevOps lifecycle, helping the broader team develop AI fluency and reducing resistance to adopting AI-assisted workflows

Improve for how AI amplifies engineering capacity — not as a novelty, but as a measurable lever for deployment reliability, developer productivity

Required

B.S. in Computer Science, Engineering, Information Systems, or a related technical field, or equivalent practical experience

8+ years of experience in DevOps, release engineering, or a similar role supporting enterprise environments

Hands-on experience with Salesforce CLI, change sets, and Salesforce metadata deployments

Proficiency with GitLab CI/CD pipelines and Terraform for infrastructure provisioning

Experience managing release processes across multiple interconnected systems (Salesforce, Boomi, AWS)

Troubleshoot with the ability to resolve deployment failures

Collaborate to work with multiple engineering teams

Experience implementing release governance practices such as approval gates, dependency checks, and rollback procedures

Experience applying AI-powered tools and automation (e.g., GitHub Copilot, AI-assisted code reviews, or AI-driven testing frameworks) to improve deployment efficiency and reduce manual effort

Familiarity with Boomi or similar integration platforms and their deployment processes

Experience with Salesforce DevOps Center or third-party Salesforce release management tools (Copado, Gearset, or Flosum)

Knowledge of AWS CloudFormation, CDK, or other infrastructure-as-code tooling beyond Terraform

Exposure to SRE practices, incident management frameworks (e.g., Firehydrant, Opsgenie), and observability platforms (e.g., Datadog, Splunk)

Relevant certifications such as AWS DevOps Engineer, Salesforce Administrator/Developer, or HashiCorp Terraform Associate

Benefits

Paid time off

Paid parental leave

Many Avalara employees are eligible for bonuses.

Private medical insurance, varying by location

Life insurance, varying by location

Disability insurance, varying by location

Remote role

8 employee-run resource groups, each with senior leadership and executive sponsorship
