Cover letter

Capgemini - Salesforce Developer

Job URL

Dear Hiring Manager,

Capgemini’s search for a skilled Salesforce Developer with deep expertise in Salesforce Data Cloud aligns precisely with my seven-plus years of delivering scalable, AI-enabled Salesforce solutions in enterprise environments. My experience leading Data Cloud implementations—covering data ingestion, transformation, identity resolution, and segmentation—directly addresses your requirement to architect and scale enterprise-grade Salesforce applications.

At Docker, Inc and AWS, I designed robust custom applications leveraging Apex, Lightning Web Components, and Agentforce AI features that enhanced automation and user experience. I have successfully built secure, maintainable code with 75%+ Apex coverage, enforced through tools such as PMD, Checkmarx, and SonarQube. Additionally, I established and optimized CI/CD pipelines using Salesforce DX, Jenkins, GitHub Actions, and Azure DevOps, enabling reliable automated deployments.

My expertise with integration patterns including REST, SOAP, and Platform Events ensures seamless connectivity with external systems, while adherence to secure coding and data governance aligns with your compliance focus. These skills, combined with a strong mentoring track record, position me well to deliver end-to-end solutions and accelerate Salesforce innovation at Capgemini.

Thank you for considering my application. I look forward to the possibility of contributing to your team.
