Celigo - Senior Developer

Job URL

Dear Hiring Manager,
I am excited to apply for the Senior Developer role at Celigo, where solving complex integration challenges and leveraging AI-enabled automation are central to business success. With over seven years of experience in Salesforce development and cloud integration, I have designed and delivered scalable, secure API-driven integrations between ERP systems (including NetSuite and Microsoft Dynamics) and SaaS platforms such as Salesforce and Amazon.

At Docker, I architected and implemented Celigo integrator.io dataflows and agentic automation services, achieving a 30% reduction in manual tasks through AI-driven workflows. My expertise spans full integration lifecycles—from requirements gathering, client advisory, and scalable solution design to deployment, testing, and post-go-live support—aligning closely with Celigo's client-centric delivery approach.

I bring strong proficiency in API management (REST, SOAP, OAuth), JavaScript-based transformation hooks, data mapping (JSON, XML, CSV, EDI), and agentic MCP server orchestration. These skills, coupled with extensive client engagement experience and mentoring capabilities, enable me to deliver high-value integration solutions and elevate team performance.

My background and technical leadership transfer naturally to Celigo's innovative platform, and I am eager to contribute to your mission of simplifying integration and automation for your clients. Thank you for considering my application.
