Cover letter

Elastic - Senior Salesforce Engineer

Job URL

Dear Hiring Manager,

I am excited to apply for the Senior Salesforce Engineer role at Elastic, where my extensive background in full-stack Salesforce development, enterprise integrations, and AI-assisted software engineering aligns closely with your needs. Over the past 7+ years, I have designed and delivered scalable Salesforce solutions encompassing Lightning Web Components, Apex, REST APIs, and MuleSoft-inspired integration patterns. My experience automating complex revenue and service processes, along with leading end-to-end feature development in Agile environments, complements Elastic’s goals to scale platform architecture and improve revenue automation.

At Docker, I engineered AI-assisted Salesforce development workflows using GitHub Copilot and Cursor, enabling faster, more reliable code delivery while maintaining security and performance rigor. Additionally, I built Agentforce-powered AI case triage automations which significantly enhanced business workflow efficiency. At AWS, I improved integration resiliency and reduced support tickets by innovating self-service Experience Cloud portals and asynchronous event-driven Salesforce integrations.

My deep proficiency with Salesforce's full technology stack, modern frontend technologies, and AI-assisted coding tools positions me to quickly contribute to Elastic’s innovative platform initiatives. I am eager to bring my passion for clean code, secure architecture, and scalable automation to your talented team and help solve your key engineering challenges.

Thank you for your consideration.

Sincerely,
Triet Le
